

CareMatrix AI

Where Vision Meets Vigilance.

An NVIDIA and Dell-optimized Physical AI based vision & agentic reasoning with continuous knowledge-graph updating system for autonomous elderly fall and health-surveillance.

“My goal is to reimagine elder care with autonomous vision and agentic intelligence - delivering fall prediction, posture monitoring, and real-time health insights that make caregiving proactive, precise, and scalable. The mission is a global AI platform that safeguards elders through continuous, intelligent health surveillance, enabling longer, safer, independent living.”

Ex Boeing
MS in Data Science @Columbia University

Elderly Falls - A GLOBAL EMERGENCY

~6,46,000

Worldwide deaths

37 Million

Critical Injuries

annually (across all age groups, older data)

~44,000

Deaths across USA

9 Million

Critical Injuries

From 2003 to 2023, the rate increased more than 70% for adults ages 65 to 74, and more than 75% for those aged 75 to 84. It more than doubled for seniors 85 and older.

~1,66,518

Deaths across India

1.5–2 Million

Critical Injuries

Around 12.5% of older adults in India experience falls, with rates increasing with age, peaking in those 80+ (8.84%).

Over 65% of fallers suffer injuries, with fractures (12.5%), dislocations/sprains (14.31%), and head/neck injuries (7.55%) common.

~93,378

Deaths across China

9.76 Million

Critical Injuries

Define how you'll generate income from this source. Identify relevant pricing or channels.

2nd

leading cause of accidental injury deaths worldwide, with an estimated 646,000 individuals dying from falls each year, majorly among adults over 65 age.

“If deployed at global scale, our Dell + NVIDIA agentic computer-vision system could prevent up to 3,00,000 deaths and over 15 million severe injuries every year, making it one of the most impactful elder-safety innovations of this decade.

Why is CareMatrix AI critical in the current market?

1. TAM - Total Addressable Impact (Global Scale)

Metric	25% Prevention	40% Prevention
Lives Saved	1,70,000–200,000	270,000–320,000
Injuries Prevented	9–10 million	15 million+

2. SAM - Serviceable Available Market

US, China, EU, Japan, South Korea,
Urban India ≈ 300 million elders

Lives Saved per Year

- 75,000–1,10,000 lives
(at 25–40% prevention range)

Injuries Prevented per Year

- 4–6 million severe injuries

3. SOM - Serviceable Obtainable Market (First 3 Years)

- US assisted living facilities
- Indian metro hospitals
- China urban elder-care programs
- Corporate elder-care insurers
- Pilot deployments in 50–100 facilities

**Realistically reachable elders in 3 years:
5–10 million elders monitored**

Nvidia & Dell Usage

Dell/Nvidia Advantage

- Reliable edge compute for hospitals/elder homes
- Multi-stream video pipelines with high throughput
- Scalable deployment: room -> floor -> building -> city
- Enterprise agreements with healthcare systems

Startup USP Advantage

- Physical AI + vision + agentic reasoning + knowledge-graph updating
- Continuous summaries + alerts - saves caregiver time & lives
- Modular -> can launch as SaaS, hardware bundle, or API layer
- Clinical validation possible in 6–12 months

Fall-Risk AI System

Real-time fall detection powered by YOLO and an emergency timeline.

Live Detection Feed

Real-Time Agent Summary

No fall detected.

We don't just provide the cure, we PREVENT!

Before the accidents happen, the real time monitoring system will provide continuous updates including prediction of fall, detection of obstacles, close proximity of fall.

During the Fall

The system gives warning of family SOS, and confirms the fall

After the Fall - Emergency and 911 service integrations

After locking the fall confirmation, our system continuously provides observer the option to connect family SOS, call 911 and other emergency actions based on the time and posture of fall duration.

Fall-Risk AI System

Real-time fall detection powered by YOLO and an emergency timeline.

Live Detection Feed

Real-Time Agent Summary

Person on ground for 5 sec.

Control Panel

Video file path

data/raw/le2i/Home_01/Hor

Stop Video

Fall-Risk AI System

Real-time fall detection powered by YOLO and an emergency timeline.

Live Detection Feed

Real-Time Agent Summary

30 SECONDS DOWN — EMERGENCY DETECTED. CALL 911!

1. Dataset

I used a **multi-dataset fusion strategy** to maximize robustness and reduce model bias:

Datasets :

1) Kaggle Fall Detection Dataset (Le2i subset)

Used for supervised training of fall vs. non-fall classification and temporal fall sequence modeling.

2) Daily-Living Human Activity Dataset

Used to teach the model normal motion patterns - helps reduce false positives for bending, sitting, picking objects.

3) UR Fall Detection Dataset (URFD)

Used for high-acceleration fall events, strong frontal/side-view falls - increases sensitivity for fast incidents.

4) FDD Dataset

Used for environmental diversity: bedrooms, corridors, assisted-living homes - generalizes model to different camera angles.

Combining them :

- Preprocessed all datasets into a **unified 30 FPS - 8 FPS pipeline**
- Extracted **pose keypoints, bounding box tracks, and optical flow vectors**
- Created a **3-stream input representation**:
RGB frame + Motion flow + Skeleton keypoints
- Trained using **weighted sampling** to avoid dataset imbalance (fall events are rare)

1. COMPUTER VISION PIPELINE + OUTPUTS

I implemented a hybrid CV architecture:

Component	Model	Purpose
Person Detection	YOLOv8-nano (real-time optimized)	Detect humans in frame
Pose Estimation	Ultralytics RTMPose	Track body joints & orientation
Motion Analysis	RAFT Lite (optical flow)	Detect fast downward motion
Sequence Fall Classifier	Temporal CNN / LSTM	Determine if trajectory = fall

```
{  
  "posture": "lying/standing",  
  "confidence": 0.9-1,  
  "time_on_ground": 12.4,  
  "fall_detected": true/false  
}
```

3. Agentic Layer

Domain specific rule based agent -

YOLO model detects whether a person is in *fall* class (class 0).

The detection signal becomes the agent's "observation".

Condition	Agent Action
No fall	Reset memory, "No fall detected"
Fall detected	Start timer + "Fall Confirmed - Call Family?"
5 seconds	"Person on ground for 5 sec"
10 seconds	"Person on ground for 10 sec"
20 seconds	High-risk warning
30 seconds	Emergency → "CALL 911!"

Output (Agent Actions)

- Updates real-time alerts
- Issues escalating emergency warnings
- Chooses UI severity (info, warning, error)
- Automatically governs safety escalation

4. Physical AI

How CareMatrix AI **perceives** physical human activity and converts it into **safety decisions**.

Component	Function	Your System Implementation
Perception	Understand physical posture from video	YOLO detects fall class and converts pixels -> signals
Temporal Understanding	Measure how long a person stays down	Timer starts on fall; session state tracks duration
Safety Intelligence	Judge risk level	Classifies states: harmless -> risky -> critical
Human-Centered Emergency Logic	Trigger appropriate actions	Escalates alerts (family -> high risk -> call 911)

Customer segments

Places Where CareMatrix AI can be Implemented Specifically for Elderly Care

At-Home Elder Care

Seniors living alone
Remote caregiving setups
Home nursing services

Assisted Living Facilities

Senior living communities
Rehabilitation homes
Memory care units

Nursing Homes

High-risk patients
Dementia/Alzheimer's monitoring
Bed-fall detection in shared rooms

Hospitals With Elderly Wards

Geriatric wards
Emergency rooms
Post-surgery fall-risk patients

Elder Transportation & Mobility Services

Wheelchair transport monitoring
Shuttle services inside senior communities

Industry segments

Other Industries / Use-Cases where CareMatrix AI Systems Could be Implemented (Non-Elderly)

Workplace Safety & Industrial Environments

Construction sites - fall-from-height detection

Manufacturing plants - worker collapse, unsafe posture detection

Mining - worker fatigue, collapse, gas exposure incidents

Oil & gas rigs - slipping, unconsciousness detection

Hospitals & Healthcare (Non-elderly patients)

ICU patient fall & motion monitoring

Post-operative fall risk prediction

Rehabilitation movement tracking

Sports & Athletics

Concussion detection

Collision impacts in football, hockey, rugby

Real-time pose analytics for injury prevention

Transportation & Public Infrastructure

Subway/rail platforms - detecting person falling onto tracks

Airport walkway - motion abnormalities, fainting

Traffic cameras - biker/motorcyclist fall detection

Defence & Military

Soldier down detection in training grounds

Unconscious/immobilized personnel alerts

Technical Future

“Today we detect falls. Tomorrow we predict, prevent, and autonomously respond to them using agentic multimodal intelligence.”

Current Technology

Computer
Vision

Agentic AI

Knowledge
Graph

UI Application

Goals

- Utilize more powerful LLMs
- Move from Single-Camera CV to Multimodal Fall Understanding
- Integrate privacy and personal database access (Family SOS, 911 SOS)

Depth sensors	Thud Sounds
Wearables	heart-rate
Audio Cues	Gasp, call for help
Thermal Cameras	Night Detection
Location	Which room riskier
Floor/Object Mapping	Water, Objects, etc.

Pose Detection

Hip-Knee Angle

Sudden Loss of Vertical key points

Hip-shoulder angle

Partnerships/Outsourcing

- ISmart lights turn on automatically during fall
- Alexa/Google Home integration
- Door unlocks for emergency responders
- Public Safety Organizations
- City Police Department

Keep in touch. Thankyou!
